Understanding Freezing Point Depression

Before diving into specific solutions, it's crucial to understand the fundamental concept of freezing point depression, which is central to solutions lab 33.

What Is Freezing Point Depression?

Freezing point depression refers to the decrease in the freezing point of a solvent when a solute is dissolved in it. This phenomenon occurs because the presence of solutes disrupts the formation of the solid (ice) phase, requiring a lower temperature to achieve freezing.

Key formula:

$\Delta T_f = i \times K_f \times m$

Where:

- ΔT_f = change in freezing point (in °C)
- i = van't Hoff factor (number of particles the solute dissociates into)
- K_f = cryoscopic constant of the solvent (in °C·kg/mol)
- m = molality of the solution (mol solute / kg solvent)

Note: The actual freezing point of the solution is:

[

$$T_{f,\text{solution}} = T_{f,\text{solvent}} - \Delta T_f$$

]

Sample Problems and Solutions

Example 1: Calculating Freezing Point Depression

Problem:

A solution is prepared by dissolving 10 grams of NaCl in 500 grams of water. Given that K_f for

water is $1.86^{\circ}\text{C}\cdot\text{kg/mol}$, calculate the freezing point of the solution. Assume complete dissociation of NaCl ($i=2$).

Solution:

- Calculate moles of NaCl:

$$\text{Moles} = \frac{10\text{ g}}{58.44\text{ g/mol}} \approx 0.171\text{ mol}$$

- Calculate molality:

$$m = \frac{\text{moles of solute}}{\text{kg solvent}} = \frac{0.171}{0.5} = 0.342\text{ mol/kg}$$

- Calculate ΔT_f :

$$\Delta T_f = i \times K_f \times m = 2 \times 1.86 \times 0.342 \approx 1.27^{\circ}\text{C}$$

- Calculate new freezing point:

$$T_{f,\text{solution}} = 0^{\circ}\text{C} - 1.27^{\circ}\text{C} = -1.27^{\circ}\text{C}$$

Answer: The freezing point of the solution is approximately -1.27°C .

Example 2: Determining Molality from Freezing Point Depression

Problem:

A solution has a freezing point depression of 0.93°C . If the solute is NaCl with $(i=2)$ and the solvent is water ($(K_f=1.86^{\circ}\text{C}\cdot\text{kg/mol})$), what is the molality of the solution?

Solution:

- Rearranged formula:

$\Delta T_f = i \cdot K_f \cdot m$

$$m = \frac{\Delta T_f}{i \cdot K_f} = \frac{0.93}{2 \cdot 1.86} \approx \frac{0.93}{3.72} \approx 0.25 \text{ mol/kg}$$

Answer: The molality of the solution is approximately 0.25 mol/kg .

Important Tips for Accurate Solutions in Lab 33

- Always verify the dissociation factor ((i)) based on the solute's behavior in solution.

Introduction to Freezing Point and Its Significance

What is Freezing Point?

The freezing point of a substance is the temperature at which it transitions from a liquid to a solid under standard atmospheric pressure. For pure substances, this temperature is well-defined; for solutions, it varies depending on solute concentration and nature.

Why Is Freezing Point Important?

- Purity Assessment: Freezing point depression is used to determine the purity of a sample.
- Determining Molar Mass: Colligative properties, including freezing point depression, help estimate molar masses of unknown solutes.
- Industrial Applications: Freezing point data influences formulations in pharmaceuticals, food preservation, and cryogenics.

Understanding Freezing Point Depression

The Colligative Property Framework

Freezing point depression is a colligative property, meaning it depends solely on the number of solute particles, not their identity. The fundamental equation is:

$$\Delta T_f = i \cdot K_f \cdot m$$

where:

- ΔT_f = depression in freezing point ($^{\circ}\text{C}$)
- i = van't Hoff factor (number of particles the solute dissociates into)
- K_f = freezing point depression constant of the solvent ($^{\circ}\text{C}\cdot\text{kg/mol}$)
- m = molality of the solution (mol solute per kg solvent)

Key Variables and Their Impact

- Van't Hoff Factor (i): For ionic compounds, dissociation increases i , thus increasing depression.
- Molality (m): Higher molality results in greater depression.
- Solvent Specifics: Each solvent has a characteristic K_f , influencing the extent of depression.

Solutions Lab 33: Typical Questions and Their Solutions

Common Question Types

Solutions Lab 33 often presents problems such as:

- Calculating the molality or molar mass of an unknown solute based on freezing point data.
- Determining the amount of solute needed to lower the freezing point to a specific value.
- Analyzing how dissociation affects freezing point depression.

Sample Problem Breakdown

Example:

A 0.500 molal solution of an unknown electrolyte lowers the freezing point of water by 0.740°C. Assuming complete dissociation into two ions, what is the molar mass of the solute?

Step-by-step approach:

- Identify Known Values:
 - $\Delta T_f = 0.740^\circ\text{C}$
 - K_f for water = $1.86^\circ\text{C}\cdot\text{kg/mol}$
 - $i = 2$ (assuming complete dissociation into two ions)

- Calculate Molality:

[

$$\Delta T_f = i \times K_f \times m$$

]

[

$$m = \frac{\Delta T_f}{i \times K_f} = \frac{0.740}{2 \times 1.86} \approx 0.199 \text{ mol/kg}$$

]

- Determine Moles of Solute per kg of solvent:

Since molality $m = 0.199$, mol/kg , for 1 kg of solvent, moles of solute = 0.199 mol.

- Find the Molar Mass:

If a known amount of solute is added, say 0.199 mol, and the mass of the solute is m_{solute} , then:

[

$$\text{Molar mass} = \frac{m_{\text{solute}}}{\text{moles}}$$

]

Assuming the total mass of solute used in the sample is known (say, from experimental data), you can compute the molar mass accordingly.

Common Challenges and Solutions in Interpreting Freezing Point Data

Dealing with Dissociation and Association

- Ionic compounds often dissociate, increasing i . For example, NaCl dissociates into Na^+ and Cl^- , so $i \approx 2$.
- Some compounds may associate, reducing i below the expected value.

Tip: Always verify dissociation behavior for the specific solute.

Correctly Calculating Molality and Molar Mass

- Ensure the units are consistent.
- Remember that molality is independent of the total solution volume.
- Use the correct K_f value for the solvent.

Handling Experimental Errors

- Temperature measurements should be precise.
- Account for impurities that may affect freezing point.

- Repeat measurements for accuracy.
