Sample Solutions and Walkthroughs for Easley and Kleinberg Exercises

Example 1: Maximum Flow Problem

Suppose you are given a directed network with capacities and asked to find the maximum flow from source s to sink t .

- Model the network as a graph with nodes and directed edges with capacity values.
- Initialize flow to zero on all edges.
- Use the Ford-Fulkerson algorithm:
 - Find an augmenting path using BFS or DFS.
 - Update capacities along the path.
 - Repeat until no augmenting paths remain.
- The sum of flows into t is the maximum flow.

Example 2: Shortest Path Calculation

Given a weighted network, find the shortest path from node A to node B.

- Choose the appropriate algorithm (Dijkstra's for non-negative weights).
- Initialize distances, setting the start node A to zero and others to infinity.
- Use a priority queue to select the next node with the smallest tentative distance.
- Update neighboring node distances if a shorter path is found.
- Continue until reaching node B or exploring all nodes.
- Trace back the path from B to A to identify the shortest route.

Example 3: Network Connectivity and Critical Nodes

Identify nodes whose removal disconnects the network.

- Calculate the network's connectivity using algorithms like Tarjan's for articulation points.
- Remove identified critical nodes and observe the impact on network connectivity.
- Assess network resilience by simulating failures and measuring the size of the largest connected component.
