Step 6: Summarize and Calculate the Rate

- Sum all the costs to determine the total expenditure.
- Divide the total cost by the quantity of work (e.g., per cubic meter or per 1000 blocks) to get the rate per unit.

Sample Rate Analysis for Solid Block Masonry

Let's consider a hypothetical example to illustrate the process.

Assumptions:

- Wall size: 10m length x 3m height = 30m²
- Thickness: 200mm (1 block thick)
- Mortar ratio: 1:6 (cement:sand)
- Material rates:
- Solid blocks: ₦45 per 1000 blocks
- Cement: ₦300 per 50kg bag
- Sand: ₦600 per ton
- Labor wages:
- Mason: ₦500 per day
- Helper: ₦300 per day
- Productivity:
- Mason: 10m² per day
- Helper: 15m² per day
- Tools and miscellaneous expenses: 10% of material and labor costs

Calculations:

- Quantity of Blocks:

- Volume of wall = 10m x 3m x 0.2m = 6m³
- Number of blocks per m³ ? 500 (assuming 0.4m x 0.2m x 0.2m blocks)
- Total blocks = 6m³ x 500 ? 3000 blocks
- Including 10% wastage: 3000 + 300 ? 3300 blocks

- Material Costs:

- Blocks: (3300/1000) x ₦45 ? ₦148.50
- Cement:
- Mortar ratio 1:6; total mortar volume ? (per m² calculation)
- Approximate cement requirement ? 0.02 tons (20 kg) per m²
- Total cement = 30m² x 0.02 tons = 0.6 tons
- Number of bags = 0.6 tons / 0.05 tons = 12 bags
- Cement cost = 12 x ₦300 = ₦3600
- Sand:

- Sand requirement ? 0.04 tons per m²
- Total sand = 30 x 0.04 = 1.2 tons
- Sand cost = 1.2 x ?600 = ?720

- Labor Costs:

- Mason:
- Number of days = 30m² / 10m²/day = 3 days
- Wages = 3 days x ?500 = ?1500
- Helper:
- Number of days = 30m² / 15m²/day = 2 days
- Wages = 2 days x ?300 = ?600

- Tools and Miscellaneous Expenses:

- Assuming 10% of material + labor costs
- Calculate total material + labor = ?148.50 + ?3600 + ?720 + ?1500 + ?600 = ?6418.50
- Miscellaneous = 10% of ?6418.50 ? ?641.85

- Total Cost:

- ?148.50 (blocks) + ?3600 (cement) + ?720 (sand) + ?1500 (mason) + ?600 (helper) + ?641.85 (miscellaneous) ? ?9,210.35

- Rate per Cubic Meter:

- Total volume = 6m³
- Rate = ?9,210.35 / 6 ? ?1,535 per m³

Rate analysis for solid block masonry is a fundamental aspect of construction planning and cost estimation. It involves calculating the approximate cost of constructing a solid block masonry wall by analyzing the various components, materials, labor, and machinery involved. Accurate rate analysis ensures that project budgets are realistic, resources are allocated efficiently, and timelines are maintained. This article delves into the intricacies of rate analysis for solid block masonry, providing a comprehensive guide for engineers, contractors, and students alike.

Introduction to Solid Block Masonry

Solid block masonry is a prevalent method for constructing load-bearing and partition walls in residential, commercial, and industrial buildings. It utilizes solid concrete or fly ash bricks that are typically larger in size compared to traditional bricks, which helps in reducing the time and effort involved in construction. The durability, fire resistance, and thermal insulation properties of solid blocks make them a preferred choice.

Understanding the components involved in solid block masonry is crucial for accurate rate analysis. These include the raw materials (cement, sand, blocks), labor, machinery, transportation, and miscellaneous expenses such as scaffolding and curing.

Methodology of Rate Analysis

Rate analysis for solid block masonry involves breaking down the entire process into smaller, measurable activities and estimating their costs based on prevailing market rates and productivity standards. The main steps include:

- Quantifying materials required
- Estimating labor hours
- Calculating machinery and equipment costs
- Including overheads and profit margins

A systematic approach ensures comprehensive coverage of all elements affecting the overall cost.

Components of Rate Analysis for Solid Block Masonry

1. Materials

The primary materials in solid block masonry are:

- Solid blocks (concrete or fly ash bricks)
- Cement
- Sand (fine aggregate)
- Water

Additional materials such as curing compounds or admixtures may also be considered.

2. Labor

Labor cost depends on the skill level required for different tasks:

- Bricklaying
- Laying and leveling
- Curing and finishing

Productivity rates are generally obtained from standard data or site experience.

3. Machinery and Equipment

Machinery involved includes:

- Mixer machines
- Lifting cranes or hoists
- Scaffolding and formwork

Their costs are calculated based on usage hours and depreciation.

4. Overheads and Profit

Overheads include administrative expenses, safety measures, transportation, and contingencies. Profit margins are added based on company policies.

Calculation of Materials

1. Quantity of Solid Blocks

The number of blocks required depends on the wall dimensions and the size of each block. For example, for a wall measuring length L , height H , and thickness T , the total number of blocks (N) can be estimated as:

$$N = \frac{L \times H \times T}{\text{Area of one block}}$$

Where the area of one block is known from its dimensions.

2. Cement and Sand Calculation

The mortar proportion (e.g., 1:6 for cement:sand) determines the quantities needed per unit volume of masonry. The volume of mortar required is calculated based on the joint thickness and the total wall volume.

Example:

- Mortar volume per cubic meter of masonry: approximately 0.039 m³
- Cement consumption: based on mix ratio and total mortar volume
- Sand consumption: derived from cement and mortar ratio

Labor Cost Estimation

Labor productivity varies depending on the skill level, complexity, and site conditions. Standard productivity rates are often taken from published manuals or site experience.

Typical productivity rates:

- Laying solid blocks: 20-30 m² per day per skilled mason
- Mixing mortar: 1 m³ per hour
- Curing and finishing: as per standard practices

Labor costs are calculated by multiplying the total man-hours required by the prevailing wage rates.

Machinery and Equipment Costs

Machinery costs are usually calculated as:

$$\text{Total cost} = \text{Cost per hour} \times \text{Number of hours}$$

For example:

- Mixer machine: hourly rental rate × hours used
- Cranes: hourly rate based on capacity and usage duration
- Scaffolding: rental cost per day × number of days

Proper estimation includes maintenance and depreciation.

Overheads and Profit Margin

Overheads cover administrative expenses, site supervision, safety measures, and miscellaneous expenses like transportation. A typical percentage (e.g., 10-15%) is added to the total cost.

Profit margins vary but are generally around 5-10%, depending on market conditions and project scale.

Sample Rate Analysis Calculation

To illustrate, consider constructing a 10 m long, 3 m high, solid block wall with a thickness of 0.2 m.

Step 1: Material Quantities

- Volume of masonry: $(10 \times 3 \times 0.2 = 6, \text{m}^3)$
- Number of blocks:

Assuming each block measures 0.4 m (length) $\times$ 0.2 m (height) $\times$ 0.2 m (thickness):

$$[\text{Area of one block} = 0.4 \times 0.2 = 0.08, \text{m}^2]$$

Number of blocks:

$$[N = \frac{10 \times 3}{0.4 \times 0.2} = \frac{30}{0.08} = 375, \text{blocks}]$$

- Cement requirement (assuming 1:6 mix):

Total mortar volume:

$$[6, \text{m}^3 \times 0.039, \text{m}^3 / \text{m}^3 = 0.234, \text{m}^3]$$

Cement:

$$[\frac{1}{6+1} \times 0.234, \text{m}^3 \approx 0.033, \text{m}^3]$$

Considering 1 bag of cement = 0.035 m³, approximately 1 bag is needed.

Sand:

$$[6 \times \text{cement ratio} = 6 \times 0.033 \approx 0.198, \text{m}^3]$$

Step 2: Cost Estimation

Using current market rates:

- Solid blocks: Rs. 35 per block ? Rs. 13,125

- Cement: Rs. 300 per bag ? Rs. 300
- Sand: Rs. 800 per m³ ? Rs. 160
- Labor: Assume Rs. 200 per m³ of masonry; for 6 m³ ? Rs. 1200
- Machinery: Mixer rental Rs. 500 per day, used for 1 day ? Rs. 500
- Overheads (15%): Calculated on material + labor + machinery cost

Total cost:

$$\text{Sum of direct costs} = \text{Rs. } (13,125 + 300 + 160 + 1200 + 500) = \text{Rs. } 15,285$$

Overheads:

$$15\% \times 15,285 = \text{Rs. } 2,293$$

Profit (10%):

$$10\% \times (15,285 + 2,293) = \text{Rs. } 1,752.80$$

Final Estimated Rate:

$$\text{Rs. } 15,285 + 2,293 + 1,753 \approx \text{Rs. } 19,331.80$$

Per square meter:

$$\frac{19,332}{(10 \times 3)} = \text{Rs. } 644.40 \text{ per m}^2$$

This detailed calculation highlights the comprehensive nature of rate analysis.
