matlab code of enhanced lee filter

In the realm of image processing, especially when dealing with synthetic aperture radar (SAR) images, speckle noise poses a significant challenge. It can obscure important details and reduce the interpretability of images. To address this issue, various filtering techniques have been developed, among which the Enhanced Lee Filter stands out due to its capability to effectively reduce speckle noise while preserving edges and fine details. Implementing this filter in MATLAB allows researchers and engineers to integrate it seamlessly into their image processing workflows. In this article, we will explore the MATLAB code of the enhanced Lee filter in detail, including its theoretical background, implementation steps, and practical usage.

Understanding the Enhanced Lee Filter

What Is Speckle Noise?

Speckle noise is a granular interference that inherently occurs in coherent imaging systems such as SAR, ultrasound, and laser imaging. It results from the constructive and destructive interference of coherent waves reflected from multiple scatterers within the resolution cell. While speckle can provide some information about surface roughness and texture, it generally hampers image interpretation and analysis.

Traditional Lee Filter

The classic Lee filter is a popular choice for speckle reduction. It assumes that the noise follows a multiplicative model and aims to estimate the true reflectivity by considering local statistics. The filter adapts its smoothing based on the local variance, thereby preserving edges.

Enhanced Lee Filter

The enhanced Lee filter improves upon the traditional version by incorporating additional statistical measures, such as the coefficient of variation and adaptive windowing, to better distinguish between noise and genuine image features. This results in superior edge preservation and noise reduction.

Mathematical Foundation of the Enhanced Lee Filter

The enhanced Lee filter operates based on local statistical analysis:

- Local Mean (μ): Average intensity within a window.
- Local Variance (σ^2): Variance within that window.
- Coefficient of Variation (CV): $\text{CV} = \frac{\sigma}{\mu}$.

The filter estimates the restored pixel value Z as:

[

$$Z = \mu + \text{K} \times (I - \mu)$$

]

where:

- I is the original pixel intensity,
- K is the smoothing coefficient computed as:

[

$$\text{K} = \frac{\sigma^2 - \text{NoiseVariance}}{\sigma^2}$$

]

The algorithm adjusts K based on local statistics, leading to adaptive filtering.

Implementing the Enhanced Lee Filter in MATLAB

Prerequisites

Before diving into the code, ensure you have:

- MATLAB installed on your system.
- Image Processing Toolbox (optional but recommended for advanced functions).

Step-by-Step MATLAB Implementation

Below is a comprehensive MATLAB code implementing the enhanced Lee filter:

```
```matlab
```

```
function filtered_img = enhanced_lee_filter(noisy_img, window_size, noise_variance)

% ENHANCED_LEE_FILTER Applies the enhanced Lee filter to reduce speckle noise

%

% Inputs:

% noisy_img - Input noisy image (2D matrix)

% window_size - Size of the local window (odd integer)

% noise_variance - Estimated noise variance

%

% Output:

% filtered_img - Denoised image after applying enhanced Lee filter

% Ensure the window size is odd

if mod(window_size, 2) == 0

error('Window size must be odd.');
```

```
end

% Define the half window size

hw = floor(window_size / 2);

% Pad the image to handle borders

padded_img = padarray(noisy_img, [hw, hw], 'symmetric');

% Initialize the output image

filtered_img = zeros(size(noisy_img));

% Loop over each pixel in the image
```

```
for i = 1:size(noisy_img, 1)

for j = 1:size(noisy_img, 2)

% Extract local window

local_window = padded_img(i:i+window_size-1, j:j+window_size-1);

% Compute local mean and variance

local_mean = mean(local_window(:));

local_var = var(local_window(:));

% Compute the weighting coefficient

% To avoid division by zero, add a small epsilon if local_var is very small

epsilon = 1e-8;

K = max(0, (local_var - noise_variance) / (local_var + epsilon));

% Apply the enhanced Lee filter formula

pixel_value = local_mean + K (noisy_img(i,j) - local_mean);

filtered_img(i,j) = pixel_value;

end

end

% Convert to the same data type as input

filtered_img = cast(filtered_img, class(noisy_img));

end

...
```

## Usage and Practical Considerations

## Example Usage

Suppose you have a SAR image with speckle noise:

```
```matlab

% Read an example image

original_img = imread('sar_image.tif');

% Convert to double for processing

noisy_img = double(original_img);

% Estimate the noise variance (can be calculated based on the image)

% For simplicity, assume a constant noise variance

noise_var = 0.01;

% Define window size (e.g., 5x5)

window_size = 5;

% Apply the enhanced Lee filter

denoised_img = enhanced_lee_filter(noisy_img, window_size, noise_var);

% Display results

figure;

subplot(1,2,1); imshow(original_img); title('Original SAR Image');

subplot(1,2,2); imshow(uint8(denoised_img)); title('Denoised Image with Enhanced Lee Filter');

```
```

## Parameter Selection

- Window Size: Larger windows result in more smoothing but can blur details. Typically, 3x3 or 5x5 windows are used.
- Noise Variance: Estimation is crucial; overestimating can lead to excessive smoothing, while underestimating can reduce noise suppression.
- Trade-offs: Adjust parameters based on the specific image and noise characteristics.

## Advantages of the MATLAB Implementation

- Efficient handling of local statistics.
- Adaptability to different noise levels.
- Preservation of edges and details.
- Easy integration into larger image processing pipelines.

## Extensions and Optimization

- Vectorization: For large images, vectorizing the code can significantly improve performance.
- Adaptive Windowing: Implementing adaptive window sizes based on local image features.
- Multi-Scale Filtering: Combining filters at different scales for better noise reduction.

## Matlab Code of Enhanced Lee Filter: An In-Depth Review and Implementation Guide

### Introduction

In the realm of image processing, particularly in applications involving synthetic aperture radar (SAR) imagery, the presence of speckle noise poses significant challenges to image analysis,

interpretation, and feature extraction. Traditional filtering methods often compromise between noise reduction and detail preservation. Among the various despeckling techniques, the Lee filter has gained prominence owing to its adaptive nature and computational efficiency. Building upon its foundation, the Enhanced Lee filter introduces improvements that aim to further optimize noise suppression while maintaining image fidelity.

This article provides a comprehensive examination of the Matlab code of the enhanced Lee filter, exploring its theoretical underpinnings, implementation details, and practical considerations. We delve into the mathematical formulation, coding strategies, and potential enhancements, making this a valuable resource for researchers and practitioners seeking to implement advanced despeckling methods.

## Background and Significance of Lee Filtering

### Speckle Noise in SAR Imagery

Synthetic Aperture Radar (SAR) images inherently contain multiplicative noise known as speckle. Unlike additive Gaussian noise, speckle noise is signal-dependent, making its suppression more complex. Its presence degrades the interpretability of SAR images, obstructs feature detection, and affects subsequent analysis such as classification and segmentation.

### Traditional Filtering Techniques

Various despeckling methods exist, including:

- Lee filter
- Frost filter
- Kuan filter
- Gamma MAP filter
- Non-local means and wavelet-based methods

Among these, the Lee filter is distinguished for its simplicity, efficiency, and effectiveness, especially in real-time applications.

## Theoretical Foundations of the Enhanced Lee Filter

### Basic Lee Filter

The classical Lee filter operates based on local statistics within a sliding window. It assumes that the observed pixel value  $(Z)$  is a product of the true reflectivity  $(X)$  and speckle noise  $(N)$ , i.e.,  $($

$$Z = X \times N$$

The filtering process estimates the true reflectivity  $\hat{X}$  as:

$$\hat{X} = \mu + K \times (Z - \mu)$$

where:

- $\mu$  is the local mean
- $\sigma^2$  is the local variance
- $\sigma_N^2$  is the noise variance (assumed known or estimated)
- $K = \frac{\sigma^2 - \sigma_N^2}{\sigma^2}$

The adaptive coefficient  $K$  determines the degree of smoothing, with higher smoothing in homogeneous regions and preservation of edges.

### Limitations of the Standard Lee Filter

While effective, the basic Lee filter can over-smooth edges and fine details, especially in heterogeneous regions. It also relies on accurate estimation of noise variance and local statistics, which can be challenging.

### The Enhanced Lee Filter

The Enhanced Lee filter introduces modifications to address these limitations:

- Incorporates more sophisticated local statistics, possibly including variance stabilization.
- Uses adaptive window sizes based on local heterogeneity.
- Integrates edge-preserving mechanisms to prevent blurring of important features.
- Employs improved estimation of noise variance.

Mathematically, the enhanced filter modifies the weighting function  $K$  to better adapt to local image characteristics, often by integrating additional statistical measures or multi-scale information.

### Implementation of the Enhanced Lee Filter in Matlab

## Key Components

A typical Matlab implementation of the enhanced Lee filter involves:

- Input Image: The noisy SAR image.
- Parameter Settings: Window size, noise variance estimate, and other hyperparameters.
- Local Statistics Calculation: Mean and variance within the window.
- Adaptive Weighting: Computation of the coefficient  $\frac{1}{K}$  with enhancements.
- Filtering Operation: Applying the adaptive filter to produce the despeckled image.

Below is a detailed walk-through of a robust Matlab code implementation.
